

Brightlearn Data Analytics / Research Assignment

1. What is Database?

A database refers to a structured collection of information that is stored electronically, allowing data to be accessed, organized, managed, and modified efficiently. Databases play an important role in organizations by enabling them to store and manage large volumes of information effectively. They also assist business in making informed decisions and ensuring that their daily operations run smoothly.

Examples:

- A bank storing customer account information.
- A hospital storing patient medical records.

2. What is a Data Warehouse?

A Data Warehouse is a centralized repository that stores historical data from multiple sources for reporting and analysis.

Difference from a Database:

- Database: Used for daily transactions.
- Data Warehouse: Used for analysis and decision-making.

Why companies use it: To analyze trends, improve decision making, and generate reports.

3. What is a Data Lake?

A Data Lake is a storage system that holds raw data in its original format.
